POMEGRANATE (PUNICA GRANATUM L.) FROM MOTYA
AND ITS DEEPEST ORIENTAL ROOTS

Lorenzo Nigro - Federica Spagnoli
Sapienza University of Rome

The pomegranate bush raises its voice - tiny, insistent, and shrill: My seeds shine like the teeth of my mistress, the shape of my fruit is round like her breasts. I'm her favorite, I know, sweetest tree in the orchard, looking my best through every season.1

Pomegranate remains and representations found in the Phoenician site of Motya in Western Sicily give the cue for a summary study of this plant and its fortune in the Near East and the Mediterranean. Fruits offered in wells, a terracotta relief depicting a pomegranate held by a goddess found in the Sacred Area of the Kothon at Motya, and, especially, a pottery vase in the shape of a pomegranate retrieved inside the Temple of Astarte in the same compound, witness the symbolic transcultural role of this fruit and of the pomegranate tree in ancient Mediterranean, from its farthest oriental origins to modern art and religion.

Keywords: pomegranate; Punica granatum L.; Motya; Astarte; Demetra

1. POMEGRANATE: THE DIVINE POME [LN]

Pomegranate is a divine gift in the imagery of antiquity. It has so many evocative features: its blossom and flower, the squatted fat spherical shape of the pome, with a pointed or crowned tip (fig. 1), emblem of power; its shining red colour resembling even gold which stain at the touch; the innumerable – 613 – ruby-red seeds (actually, the fruit is made only of seeds) hinting at fecundity; its curative blood-red juice; its yellow lenticive inner rind; its oriental origins. It was depicted and reproduced in ancient art as a major symbol of fertility, abundance, perfection and sanctity.

It was because of the green splendour of the shrub, the rainbow pink and red of its flower, the purpling, crimson and shining red of the fruit, the regularly fitting geometry of the seeds. The pomegranate ripens at the end of summer, quenching with its juice the latest days of hot.

2 “When he said this, wise Persephone was filled with joy and hastily sprang up for gladness. But he on his part secretly gave her sweet pomegranate seed to eat, taking care for himself that she might not remain continually with grave, dark-robed Demeter”: F. Cassola ed. 1986, “Inno a Demetra”, Inni Omerici, vv. 370-374.
The ancient Semitic name of this fruit is “rummanu”, is both in Assyrian and Aramaic, “inhaan” or “’nhman” in Egyptian, “haraman” in Coptic, ירמון “rimmon” in Hebrew and رُمْمْان “roummana” in Arabic. Several toponyms in ancient Near Eastern sources mention the pomegranate referring to places where the tree was cultivated.3

Later on, Greek and Latin sources more generically designated the fruit as μῆλον/malum or ῥόα/pomum granatum (i.e. full of seeds), that is the antesignanus of fruits.4

Pomegranate was cultivated in Motya at least since the beginning of the Phoenician colony, in the 8th century BC, as pollen and seeds found in the excavations testify to. It was among the offering to the goddess Astarte, and depicted on a terracotta possibly portraying Demeter both found in the Sacred Area of the Kothon (§ 6.). Pomegranate trees are still present on the island.5 All these Motyan pomegranates, images, fragments and relics of ancient fruits, as well as current fruits, have been analysed to offer an overall picture of pomegranate at Motya, characterizing the fruit, and studying its uses as documented by archaeology.

3 A famous reference is in Zechariah 12:11 which mentions the site of Hadad Rimmon, just 1 Km NW of Taannek, where King Josiah died (2 Kings 23:29-30) in the battle against Pharaoh Necho (Menkheperra Nekau I, 672-664 BC). The site is identified with the modern Palestinian village of Rummanah.

4 In Greek mythology the Hesperides guarded the garden where the golden pomes grew up: these could have actually been pomegranates (see below § 4.1.).

5 Chemical pharmaceutical characterization of present-day Punica granatum L. samples from Motya examined by Prof. Rino Ragno is Sapienza, who we deeply thank, is illustrated below. Materials: 96% Ethanol, formic acid and bi-distilled water were purchased from Carlo Erba (Milan, Italy), glacial acetic acid and ethyl acetate were purchased from Fluka (Milan, Italy), acetonitrile RS for HPLC was purchased from Sigma-Aldrich Chemistry (Milan, Italy). Punicalagin (>98%) and ellagic acid (>95%) were purchased from Sigma-Aldrich Chemistry. All the other reagents were analytical grade reagents from Sigma-Aldrich Chemistry. Samples preparation: pomegranate fruits were used as whole fruit or separated in two parts: arils and peels (exocarp and mesocarp). Whole fruits or only peels, manually separated, were washed, blended in a mixer at 16000 rpm for 30 sec and extracted as described. Extraction methods - whole fruit or peels extraction with ethanol and acidified water: 10 g of the blended whole fruit or the manually separated peels were extracted with 40 mL ethanol: acidified water (5% acetic acid) in 3:1 ratio. Samples were stirred for 24 h at room temperature in the dark. The extraction mixture was well decanted and filtered on paper, then evaporated at 40 °C in the dark obtaining a purple-red sticky residue (about 1.9 g) that was stored at -20°C or immediately analyzed. HPLC analyses: the residues from the hydro-alcoholic extracts obtained from the previous described procedures, were weighed, dissolved in water and filtered before injection. HPLC analyses of anthocyanins ellagitannins were performed with a Perkin Elmer apparatus consisting of a Serie 200 LC pump, a Serie 200 DAD and a Serie 200 autosampler, including a Totalchrom Perkin Elmer software for the data acquisition. Chromatography was performed on a Luna (Phenomenex®) RP18 column (250 × 4.6 mm i.d., 5 μm) using a mobile phase composed of acetonitrile (solvent A) and water containing 5% formic acid (solvent B), which in 20 min changed from 0% A and 100% B to 15% A and 85% B and then in other 20 min changed to 45% A and 55% B, with a flow rate of 1 mL/min, at λ 350 nm and at λ 360 nm. Punicalagin anomers α and β and ellagic acid were identified in the samples by comparison of the retention times and UV spectra of pure external standards. The quantitative analyses were performed by calibration curves ranging from 1-100 mg/g (y=15.3x+26.8, with correlation coefficient R²=0.9986) for punicalagins and from 0.2-80 mg/g (y=39.6x+49.5, with correlation coefficient R²=0.9919) for ellagic acid, separately.
2. POMEGRANATE IN THE ANCIENT NEAR EAST AND THE LEVANT [LN]

The presence of pomegranate in the Levant, both the original fruit, *Punica protopunica* L., and the developed one, *Punica granatum* L., is archaeologically attested from the 4th millennium BC. The spread of this plant from the Middle to the Near East occurred between the second half of the 4th and the first half of the 3rd millennium BC, though some specimen reached the Fertile Crescent even before. This may be connected with Sumerian contacts and exchanges with the civilizations of ancient Iran, Afghanistan, Pakistan and India (Harappa and Mohenjo-daro in the Indus Valley). Long-distance trade towards India was practiced by Sumero-Akkadian city-states of Mesopotamia and Elam and this route is possibly the one through which the original pomegranate shrub (*Punica protopunica* L.) reached Mesopotamia, Anatolia, Syria and Palestine. The bigger and more developed species of *Punica granatum* L., instead, possibly developed in the Near East, as an effect of self-grafting or inosculation. Sumerians were possibly the protagonist of such development, as it is suggested by a stamp seal (fig. 2a) of the Late Uruk period with a schematic pomegranate fruit and, especially, by the representation of regular (grafted in?) three branches pomegranate trees in the lower register of the carved alabaster vase from Uruk (fig. 2b-c). The brilliant red and the yellow of its skin, the blood-red juice and the abundance of its stuffed up seeds, make the pomegranate suitable for symbolic associations with human fertility, and thus life and death. For this reason, in ancient Mesopotamian art it is often represented with the deities of fertility, fecundity, and abundance. In the Assyrian imagery pomegranate usually appears as Tree of Life (fig. 2d-e).

---

6 Taxonomy of *Punica granatum* L.: *Punica granatum* L. known as pomegranate, is a fruit-bearing deciduous shrub or small tree growing between 5 to 8 meters tall. It is planted either for its edible fruit or as an ornamental tree. Taxonomy: the pomegranate belongs to the family Lythraceae with only two different species namely *Punica granatum* and *Punica protopunica*. *Punica granatum* is the predominant species and cultivated worldwide whereas *Punica protopunica* is only restricted to the Island of Socotra (Republic of Yemen). Distribution and origin: *Punica granatum* have been cultivated in Iran, Iraq, Azerbaijan, Armenia, Afghanistan, Pakistan, India, Russia, Bangladesh and the Mediterranean region for several millennia. The origin of genus *Punica* is mainly native to Persia (modern day Iran). Name: the genus name *Punica* refers to the Phoenicians, who were active in broadening its cultivation, partly for religious reasons. The most plausible explanation for the name pomegranate is its derivation from the Latin word *pomum* meaning apple and *granatus*, which means seeded. The present vernacular name pomegranate is derived from the name *Pomum* (apple) *granatus* (grainy), or seeded apple. Utilization: owing to its medicinal and culinary utility, it has been mentioned in many ancient scriptures notably in Babylonian texts, the Book of Exodus, the Homeric Hymns and the Quran. Different part of the plant like, bark, leaves, fruit, fruit extract or juice and fruit rind have been reported to show various medicinal activities. Archaeobotany: the spread of pomegranate can be estimated by archaeological evidence, as described by Zehary and Spiegel-Roy (1975). Carbonized pips and fragments of pomegranate peels have been found from the Early Bronze Age in Jericho and Ad and remains of *Punica* species have been found in Nimrud/Iraq, in Sidon/Lebanon (Orendi - Deckers 2018), in Thera/Greece (Mavromati 2017) and Huelva/Spain (Pérez-Jordá et al. 2017). By the middle ages, pomegranate grew throughout the Levant and appeared in Egypt during the Middle Kingdom. Many wild groves can still be found thriving in the bottom of gorges throughout the Mediterranean and Central Asian region (IPGRI 2001).

7 Fateh et al. 2013, 23; Kokaj - Çakalli - Ismaili 2017, 133.

8 A clay token (or finial) found in a 4th millennium BC stratum at Susa is shaped as a pomegranate (*Punica protopunica* L.) (Schmandt-Besserat 1992, fig. 18.2).

9 Moortgat-Correns 1989, 185; Muthmann 1982, 13, figs. 4-5; Lurker ed. 1971, 147, 161; Barnett 1982, pl. 35b.
In Syria-Palestine, pomegranate seeds were found in Ebla, Tell es-Sultan/Jericho, Tell el-Jazari/Gezer, Tell el-Hesi, Tell es-Sa’idiyeh and Arad in 3rd millennium BC contexts, showing a capillary distribution at the time of the early urbanization. The spread of this species in the Levant increased in 2nd millennium BC, and it was found in almost all excavated sites where paleo-botanic samples were collected and studied. At Ebla, it has been surmised that pomegranate trees were planted in the inner courtyard of Monument P3, a monumental cultic terrace in the Sacred Area of Ishtar. They were also retrieved in Tell ed-Dab’a, where seeds were found in the forecourt of Temple III, a temple of Syro-Palestinian type. It is also possible that pomegranate trees were among the cultivated plants in the gardens of the Palace of the 13th Dynasty (1783-1640 BC). Tomb B35 at Jericho dating from Middle Bronze IIB (1700-1650 BC), roughly the same period of Tell ed-Dab’a’s attestations, yielded an desiccated fruit, a wooden box carved in the shape of a pomegranate divided into two halves was found.

In Late Bronze Age Megiddo two golden pendants in shape of small pomegranates, possibly belonged to earrings, were found in the so-called “Treasure 3073” in stratum VIIIA (LB IIB, 1300-1200 BC) Palace Palace 2041. Attestations in Egypt starts from the 2nd millennium BC - if one excludes a small jar made of breccia stone dating from the Early-Dynastic period (3150-2686 BC) (fig. 4:a) - when renewed relationships with the Levant during the 13th Dynasty favoured the diffusion of the tree. A possible identification of the name “hmn” can be read on the silver chiselled handle of a dagger from Saqqara. Attestations become significantly more numerous from the 18th Dynasty, thus suggesting that this fruit was imported from Palestine, which New Kingdom Pharaohs subjugated. Pomegranate, by instance, was found in the tomb of Djehuty, the Overseer of the Treasury during the reign of Hatshepsut at Thebes (TT110), and appears in the “Syrian Garden” of Thutmose III at Karnak (fig. 4:e). Always at Karnak, pomegranates appear in the representation of the feast of Opet. It was also found and the aristocrats’ residences of Tell el Amarna. Furthermore, from Egyptian sources and

ethnographic studies we know that ancient Egyptians made a wine from the pomegranate; the rind was prepared against intestinal diseases and used for dyeing leather. The flowers were crushed to make a red dye, which could be also obtained by swiping the peel.

Stone (steatite) and ivory models of pomegranate, golden pendants in shape of pomegranate and a silver pomegranate vessel were found in the funerary goods of the Tomb Tutankhamon (fig. 4:b-d).

The presence of pomegranate plants along the coast of the Levant at Ugarit, Byblos, Sidon, Tell el-Burak and Tyre, is attested from the 18th century BC, but possibly started in the first centuries of the 2nd millennium BC. As symbol of life and fertility, pomegranate garlands appear on the golden hemispherical bowl found in the Temple of Baal at Ugarit (fig. 5:a), and in a bronze stand for incense-burner (fig. 5:b). In the same region, pomegranate was associated to Ishtar/Astarte as regards her chthonian aspects of goddess of wild nature and fertility.

The recovery of numerous pomegranate seeds, skin fragments and flower parts from the late 14th century BC Uluburun shipwreck provides a further indication of the preciousness of this fruit in antiquity. The presence of the pomegranate within the rich cargo of the Syrian merchant ship sunk near the southern coast of Anatolia confirms that it was deemed a luxury item destined to the urban élites. The spread of the pomegranate plant and its religious symbology and utilization in 14th century BC Cyprus and Aegean are thus probably due to Canaanite and Syrian trade. Around the 10th century BC, Phoenician colonists carried it (and its symbology and religious implications) to West Mediterranean, probably also thanks to the cultural mediation of the Ionian and eastern Aegean islands, such as Rhodes and Samos, which have very active trade navies on the western sea-routes.

At Cyprus pomegranate is attested to from the 2nd millennium BC onwards. It was again connected with Astarte as symbol of fertility also in her maritime dominion (pomegranate seeds may recall fish eggs). By instance, one may quote golden pomegranates decorated pendants and necklaces found in tombs at Enkomi and Ayos Iakovos (fig. 6:a-b).

From the Iron Age pomegranate is widely spread over especially in funerary contexts of the Levant, reproduced in tombs, decorations, personal ornaments, urns and sarcophagi. This popularity is transversal to cultures and funerary customs, and affects all ethnic groups living in the Levant.

During the Iron Age I, pomegranates are typically applied to kernoi found in religious contexts. The best documented examples are known from Gezer and Megiddo (fig. 25 Loret 1892, 78.

26 Ward 2003, 530.
27 Muthmann 1982, 17 ff.
28 Pomegranate-shaped vases were found inside the Temple 131 of Tell Qasile where a goddess of fertility was worshipped: Mazar 1980a, 116, fig. 46.
29 Haldane 1993.
30 Chandra et al. 2010, 2.
32 Karageorghis 2002, 48, figs. 91-92.
33 Five kernoi with applied pomegranates were found by Macalister, plus a vase with a pomegranate applied to its rim (Macalister 1912, II, 235 ff.).
The role of pomegranates seems connected to pour liquids, as their replicas are pierced and communicate with the ring. Kernoi might have been used to offer up the pomegranate juice, as it is also documented by a small spouted jar which imitates the pomegranate crown nowadays in the Hecht Museum in Haifa. An ivory finial of sceptre carved as a slender pomegranate was found in Megiddo stratum IV (Iron IIB, 925-732 BC) (fig. 6:c).

A special mention deserves Philistine Temple 131 of Tell Qasile where two pomegranate shaped vessels with red-slipped surface and black painted bands (fig. 6:e-f) were found together with a kernos also including these fruits, and several figurines and other zoomorphic vases. A libation vessels with a bunch of pomegranates applied may recall the representations of such bunches in Thutmose III “Syrian Garden” at Karnak.

Pomegranate combusted rinds and seeds were found in Tell es-Safi/Gath in Iron Age I cultic contexts.

In the Near East and the Levant pomegranate achieves a further symbolic value connected to the kingship and continue to be reproduced on textiles, wood, ivory, precious metals, as symbolic ornaments. Already in the 2nd millennium BC, two small sceptres were found in Tell en-Nami bearing a finial in the shape of a pomegranate (fig. 7:a). In the 1st millennium BC similar pomegranate finials were set on the top of bronze or ivory rods and sceptres found in Levantine temples, and represented on the Neo-Assyrian reliefs and on Phoenician ivories. A paramount example of how pomegranate could be employed in personal ornaments and robes’ decoration is offered by the Queens’ tombs discovered underneath the North-West Palace of Ashurnasirpal II at Nimrud. Some outstanding pieces of jewellery, including diadems, pendants, earrings, beads, but also...
engraved representations on ivory boxes, are decorated with pomegranates as symbols for fertility (fig. 8). 45

Pomegranate became common decorative element in Assyrian and Achaemenid period in furniture, clothes, and architecture, as finial or appendix. Epitomie representations are those on the wall reliefs of the North Palace at Niniveh with king Ashurbanipal under an umbrella with pomegranate like finials and locks, also visible at Persepolis shading a priests (fig. 7:g-h).

3. POMEGRANATE IN THE BIBLE [LN]

The Bible provides several interesting references to pomegranate (Hebr. rimmon). 46 The earliest one is in the Book of Exodus (28:33-34 and 39:24-26) and refers to the fabrication with blue, purple and scarlet yarns of pomegranates tufts to embellish the hem of a ministerial robe. Textile “pomegranates” bordering priests’ robes were alternated to golden bells. Similar tufts characterize Near Eastern elite’s robes since the 2nd millennium BC, as shown by Old-Syrian and Old-Babylonian royal statuary. The same kind of dresses decoration might be detected in modern fringes, like those of Arabs’ keffiyeh.

Pomegranate are listed among fruitful plants (wheat, grape, fig) embellishing the Promised Land in the Book of Deuteronomy (8:8-7). 47 Garlands of two hundred bronze pomegranates 48 encircled the capitals on top of the pillars flanking the entrance of Solomon’s Temple in Jerusalem built by Phoenician architects and artisans (1 King 7:18-20, 42; 2 Kings 25:17; 2 Chron. 3:16, 4:13). Pomegranate is mentioned several times in the Song of the Songs as its halves are compared to lady’s temples behind her veil (4:13, 13, 6:7), and for it is a tree of a sacred garden (6:11, 7:2). If the pomegranate tree is dried up, this is a symbol of curse (Joel 1:12), on the contrary, its seeds are a figure of blessing (Haggai 2:19). Finally, according to Biblical tradition, pomegranate regularly bears 613 seeds, which coincides with the number of prescriptions (good deeds, mitzvot, in the Bible) in the Torah.

There exist a hypothesis concerning the identification of the “fruit of tree that is in the middle of the Garden” (the “forbidden fruit” from the tree of the knowledge of good and evil in the Eden: עץ הדעת טוב ורע) as reported in the narration of the Fall in Genesis 2-3. It might be identified with a pomegranate, in the light of the high symbolic value of it in relation with the power over life and death that it symbolizes in the Bible and Quran. For this reason, the pomegranate was also considered a Tree of Life of the terrestrial paradise.

Finally, several Biblical toponyms are derived from the name of the pomegranate: Rimmon-parez (Numbers 33, 19), ‘Ain-Rimmon = spring of the pomegranate (Joshua, 15:32 and 19:7; Nehemiah, 11:29; and Zechariah, 14:10), Gath-Rimmon = Pomegranate

45 Hussein 2016.
46 Goor 1967.
47 The whole quotation according to the Bible NIV: « 6 Observe the commands of the Lord your God, walking in obedience to him and revering him. 7 For the Lord your God is bringing you into a good land - a land with brooks, streams, and deep springs gushing out into the valleys and hills; a land with wheat and barley, grapes and fig trees, pomegranates, olive oil and honey; a land where bread will not be scarce and you will lack nothing; a land where the rocks are iron and you can dig copper out of the hills». 48 Ninety-six and one hundred according to Jeremiah 52:22-23.
Press (Joshua, 21:24), Sela Rimmon rock of pomegranate (Judges, 20:45), and Beit Rimmon = house of pomegranate (2 Kings, 5:18).49

4. POMEGRANATE IN GREECE [FS]

During the 2nd millennium BC, the pomegranate is appreciated as an exotic fruit, rare and refined, by the urban aristocracies of the Near East, and it was exchanged as a luxury item and, contemporary, it bears a strong symbolic value both in sacred and funeral spheres.

The same symbolism is transmitted to the Greek culture at the beginning of the 1st millennium BC. Even though the pomegranate tree was already cultivated in Greece, in local literary tradition the pomegranate continues to be considered as an allogeneic fruit coming from far territories and mythical places (an exotic fruit of “Paradise”). As an example, in the luxuriant garden of the palace of Alcinous King of Phaeacians, pomegranate is one of the fruit trees – pears, apples, figs and olives – that bears fruits all year round.50

One of the oldest representations of pomegranate in the Greek world, is on a pair of gold earrings found in the burial of the “Rich Lady of Areiopagus”,51 (fig. 9:a) which included several objects imported from the Near East in its funerary furnishing, dating back to the mid-9th century BC. The choice of pomegranates, as well as the presence of an ivory pyxis decorated on the lid with the representation of five models of granary, may symbolically indicate the prosperity of the family of the Lady, supported by symbols of fertility and abundance.52 In the necropolis of Kamiros (Rhodes), the pomegranate is represented on several jewel plaquettes depicting the Potnia Theron, the Mother Goddess, Lady of the wild beasts, whose relationship with the oriental goddesses of fertility is also evidenced by the common iconographic set, including also the pomegranates.

The pomegranate as attribute of a deity of fertility, in association with other Levantine votives, is attested to in the Heraion of Samos (fig. 9:b-c).53

To the pomegranate is given a divine value as fruit of the Netherworld in the myth of Demeter and Persephone/Kore.54 In 7th and 6th century BC, it appears as a standard element of Greek aristocratic tombs, both as a piece of the grave goods (fig. 9:d-e)55 or depicted on funerary vases.56

49 The same kind of toponyms appear also in the Mishnah and in the Talmud: Geva Rimmon = Hill of Pomegranate; (Tosefat Suta, 11, 14); Biq’at Rimmon = Pomegranate Valley (Jerusalem Talmud, Hagiga, Chapter 3), and, variably, Biq’at Beit Rimmon = Valley of the House of the Pomegranate (Midrash Bereshit Raba, 64, 10).

50 Od. VII, 115.

52 The representation of five granaries probably indicates also that the family of the Lady was included among the pentacosiomedimnoi, the highest social class of Archaic Athens: Coldsteram 1995, 395, pl. 97:c.

53 Immerwahr 1989, 407. The clay pomegranates found at Samos have a small hole piercing the corolla to be hung up as votive offerings: Bignasca 2000, 141.

54 Od. XI: 589.

55 CVA The Hague 1, 4, pl. 2. 9 (Attic, Geometric period); CVA Kassel 2, 18, pl. 54.3; CVA Berlin 4, 31, pl. 169.1 (Rhodes, mid-6th century BC).

56 CVA Leiden 2, 2-3, pl. 56. 4-7, 550 BC. In this Black-figured loutrophoros, ascribed to the Painter of London B76, the pomegranate is represented as a funerary offering. It is carried with other votives, as the lotus flower and the wreath, by “penguin” women in procession, dressed with fillets and necklaces.

56
In 5th century BC Greek painting, the pomegranate is often represented on funerary vessels in scenes where the fruit is offered to deceased, recalling such myth of Persephone. The pomegranate provides the nourishment for the journey of the dead across the Netherworld. Replicas of pomegranate in gold, silver, electrum, marble, breccia, ivory and pottery, including vases, found among the grave goods of aristocratic tombs are often representative of the high status of the deceased. The most popular iconographies related to pomegranates in Greece may be illustrated by the following examples: on an Attic White ground lekythos, a young woman carries ribbons and pomegranates, contained in a large basket, and a lekythos as gifts to a warrior, perhaps the deceased standing near a (funerary?) stelae (fig. 9:f). On another Attic lekythos of the same type and chronology, a woman is offering a basket containing ribbons, crowns and vases for perfumed oils, to a man holding in his hands a pomegranate and a rod or scepter during a funerary ceremony. A similar offering scene with inverted roles (woman with rod/scepter, man with funerary offerings including the pomegranate) appears on an Attic Red-Figured lekythos dated between 475 and 425 BC.

The myth of Hades and Persephone is a very popular subject in pottery, and it is largely appreciated even outside the Greek world: as an example, Hades and his bride Persephone with a pomegranate in her hands are represented at the center of an Attic Red-Figured kylix from Vulci (430 BC) in the British Museum.

Also in choroplastic the representation of the pomegranate is linked to Demeter and Kore/Persephone. Clay reproductions of pomegranates are attested as votive offerings in innumerable sanctuaries and tombs of Magna Graecia: terracotta statuettes of animals, fruits and sometimes flowers often substituted the corresponding natural, more enduring and, especially in the case of animals, less expensive subjects. Terracotta pomegranates are among the votive offerings of the sanctuary of Rossano di Vaglio, Metaponto (loc. Crucinia), Castelluccio, and in the urban sanctuaries of Metaponto and Eraclea dedicated to Demeter (fig. 10:b). The pomegranate flower is represented on a frieze adorning a tomb of Metaponto dating to the second half of the 5th century BC, and in a tomb of the necropolis of S. Arcangelo - S. Brancato (T. 23). In the 4th century BC the Punica granatum L. is represented on the wall-painted tombs of Paestum (fig. 10:c).
pomegranate is a favoured subject also in jewellery, as shown by several examples found in the rich tombs of Southern Italy in 6th-4th century BC (fig. 10:d). 68

Votive statuettes of goddesses handing a pomegranate were found in several Sicilian Thesmophoria, 69 the extra-moenia sanctuaries devoted to Demeter, allowed for married woman only, 70 where the human and agricultural fertility was celebrated. 71

Hera, Artemis and even Athena are sometimes represented with a pomegranate as an ornament. 72 In the Greek culture, therefore, the pomegranate is the symbol of those deities that, although in different intents and prerogatives, were responsible for the nature and the natural and reproductive courses of humans, animals and plants. 73

4.1. Pomegranate in Greek mythology

In Minoan and Mycenaean traditions, the pomegranate is linked to the cult of the Meteres, ancestral deities of the wild nature and fertility. 74 Such prerogatives are transmitted in Greek mythology to Demeter, 75 the goddess of luxuriant nature, and to her daughter Persephone. The pomegranate fruit holds a central role in the mythological story of these goddesses. The myth tells that Hades, the ruler of the Underworld, fallen in love with the young lady, raped Persephone, taking her in the Netherworld. Demeter, thanks to the intercession of Zeus, got her daughter back. However, Hades gave to Persephone some pomegranate seeds to eat, and by this way, he kept his bride inextricably linked to him and to the Netherworld. 76 Persephone, therefore, can stay the two thirds of the year with her mother on the earth, but she has to spend the rest of the year with her husband in the Netherworld. In this period, corresponding to the autumn/winter, the nature dies, and earth and animals do not reproduce. When in spring and summer time Persephone came back to the light, nature awakens, and the fruits grow up.

In this myth, the pomegranate plays a symbolic role of primary importance because it is the element that keeps the linkage with Hades and thus triggers the alternation of Persephone’s presence on the earth and, indirectly, natural cycles and seasons. Significantly, the pomegranate tree blooms at the beginning of summer, and its fruits are ripe at the beginning of autumn: the ripening of the pomegranate matches with the return of Persephone to Hades, and consequently the lethargy of the nature during the winter months. The pomegranate represents the seasonal passage and is a symbol of the seasons of human life. At the same time, it also indicates the faculty to trigger this change and can be interpreted as a symbol of renewal and rebirth.

69 Other attestations in De Faveri 2007, 163.
70 De Miro 2008, 48-49, fig. 8:4.
72 Bignasca 2000, 139.
73 Bonnet 1996, 94-96 for epigraphic evidences.
74 In ancient Greek religion, the figure of the Mother Goddess is probably the result of the syncretism between Minoic-Mycenaean Great Mother and Anatolic Cybele, occurred during the 7th century BC (Burkert 2010, 345, 129, n. 22: PY fr. 1202 ma-le-re te-i-ja). Given the difficulty to fit this deity through the genealogy of Greek pantheon, the Mother Goddess was later switched for Demeter and her mythology: Burkert 2010, 346.
Furthermore, in Mycenaean and Greek mythology the pomegranate is also linked to another major goddess that inherits the characteristics of the Mother Goddess. Hera, the wife of Zeus, received a tree of golden fruits from Gaia as wedding gift. The wonderful tree was planted in a Garden placed at the western borders of the Mediterranean, guarded by the nymphs Hesperides, a personification of western Ocean waves, the daughters of Night and Erebus. As a further safeguard of the Garden there was a never-sleeping, hundred-headed dragon named Ladon. The precious golden pomes (μῆλα) had the power to give immortality when eaten and were also considered in related myths as symbols of power. These characteristics, and the identity of the goddess who received the golden pomes tree, bear the suggestive hypothesis that the golden fruits were actually pomegranates. The pomegranate is, in facts, one of the most common attributes of Hera in Western Mediterranean, and, especially in Southern Italy, where the goddess was widely worshipped.

In the Phoenician pantheon, Astarte is the goddess that better embodies the power of presiding over natural rhythms and the cycle of seasons, acquiring several aspects of similar goddesses, such as Egyptian Hathor, Greek Hera and, later on, Isis and Demeter. During the 5th century BC, when the influence of the Hellenic culture over Phoenician-Punic world increased in Sicily, Astarte gathers the chthonic aspects of Demeter in cults, rituals, symbols, and iconographies epitomized by the pomegranate.

5. POMEGRANATE IN PHOENICIAN AND PUNIC MEDITERRANEAN [FS]

It is highly probable that the diffusion of pomegranate in western Mediterranean is due to Phoenician expansion as illustrated by a plea of archaeo-botanic finds and indirectly suggested by the Latin name of this fruit. Pomegranate first reached Sicily (Motya) and North Africa (Utica and Carthage) and then was Carthage itself to contribute to its capillary spread over the Baleares, the Iberian Peninsula and Sardinia, which eventually will transmit it to the Etruscan and Roman world (which fall beyond the scope of the present contribution).

5.1. Carthage and the North Africa

[…] Sed circa Carthaginem punicum malum cognomine sibi vindicat; aliqui granatum appellant.

In this renowned pass of Naturalis Historiae, Plinius the Elder tells us about the provenance and diffusion of Punica granatum L. from North Africa to other Mediterranean regions, such as Rome. Archaeo-botanic studies demonstrated that pomegranate was a very popular fruit in Carthage between the 3rd and the 2nd century BC: palaeo-botanic analysis

77 The renowned pinax from Locri Epizefiri (460 BC) represents one young lady, probably one of the Hesperides, picking pomegranates, in front of a seated woman, perhaps a bride (Hera): Orlandini 1983, n. 468.

79 Ribichini 2015.

80 Plin. Nat. Hist. 13.31; but the vicinity of Carthage is claimed more particularly as its own by the fruit the name of which is the “Punic apple”; though by some it is called “granatum”.

81 Van Zeist - Bottema 1982; van Zeist - Bottema, - van der Veen 2001, 7-8; Lancel 1992, 192-195. The conservation of pomegranates destined to exportation is the topic of Mago’s work. The Carthaginian author
of seeds found in the area of the harbor of Carthage revealed that more than half of collected samples belonged to *Punica granatum* L., thus showing the vast distribution of such fruit, which reached a peak of popularity in North Africa under the Carthaginian rule.

The presence of pomegranate at Carthage is known earlier, however, as it goes back to the 7th or even 8th century BC, when in archaic tombs terracotta replicas of pomegranate were found, like in Levant and in Greece. Nevertheless, pomegranate replicas in funerary set continue to be attested in following centuries (6th-3rd century BC).  

Pomegranate representations are very common on Tophet stelas of the 4th and 3rd century BC, again due to the symbology of this fruit in connection with death and rebirth. While in the archaic period pomegranate seems to be a prerogative of mercantile aristocracy, in the following periods it gains a great popularity in the carved imagery of subaltern classes.

The fortune of pomegranate as subject depicted on funerary stelas is probably also due to the introduction of the cult of Demeter and Kore at Carthage at the beginning of the 4th century BC, as attested to by Diodorus, during the crisis following the defeated of Himilco in Sicily.

From a mere religious point of view, the introduction at Carthage of the cults of such goddesses, like in Motya in the 5th century BC, triggered syncretistic phenomena with the other Carthaginian female deities, Astarte and, especially, Tanit, who inherited Kore’s iconography in their representations on local coins. Many attributes of Demeter and Kore in the Greek tradition, among which the pomegranate was one of the most relevant, merged into the iconography of Tanit, also thanks to the common connection of the funerary world

who lived in the 2nd century BC, was translated into Greek and Latin by Cassius Dionisius, and became a major source for Roman authors such as Plinius the Elder (Plin. Nat. Hist. 1.51; 8.84; 10.98). By illustrating Carthaginian agricultural skills, Mago describes the techniques for the preservation of pomegranates to be transported by the sea as reported by Latin sources. Mago explains that the best way to ship pomegranate and preserve their fragrance is to sunk them into sea water or in humid soil (Plin. Nat. Hist. 15.20). This may indicate the importance attributed to pomegranate production and trade in Carthage as one of the agricultural industry of Carthaginian aristocracy. This may well explain the great number of seeds of *Punica granatum* L. found in the harbour of Carthage, where these fruits underwent the preservation treatments described by Mago.

---

82 Campanella 2008, 63.
83 Xella 1969.
84 Diod. XIV. 77: [4] The Carthaginians, against whom the gods were clearly fighting, at first gathered in small groups and in great confusion and besought the deity to put an end to its wrath; thereupon the entire city was seized by superstitious fear and dread, as every man anticipated in imagination the enslavement of the city. Consequently, they voted by every means to propitiate the gods who had been sinned against. [5] Since they had included neither Kore nor Demeter in their rites, they appointed their most renowned citizens to be priests of these goddesses, and consecrating statues of them with all solemnity, they conducted their rites, following the ritual used by the Greeks. They also chose out the most prominent Greeks who lived among them and assigned them to the service of the goddesses. After this they constructed ships and made careful provision of supplies for the war. [trans. C.H. Oldfather, Cambridge, Mass.: Harvard University Press 1989] Carthage’s strategies as described by Diodorus possibly reflect some deep changes of Carthaginian politics and society, following the emergence of the agrarian oligarchy. Such socio-economic transformations affected also the religious sphere, as the introduction of the cult of Demeter and Kore among the official cults of the city testifies to. These new cults were put under the control of the most eminent Greek inhabitants of the city. They denote a renovated attention towards what was happening in Carthage’s protectorate in Sicily, as also the following military activities will demonstrate: De Vincenzo 2012, 20.

85 Acquaro 2008.
of the two goddesses, Kore and Tanit. Such associations are made evident by the imagery of Punic and Neo-Punic stelas found in necropolises, tophets and temples of North Africa, where the pomegranate is a very common motive, either as main figurative element, and as attribute of Tanit, represented on the top with bunches of grapes and ears of wheat (fig. 11:a), or part of the decorative frames. In some cases, the pomegranate appears in the hands of the dead or the deity standing at the middle of the carved representation. Moreover, from stelas representations we may infer that pomegranate played also a role in architectural decorations: on a stela from Carthage dating to the 2nd century BC it appears over the capital of an Ionic column in what is interpreted as a temple (fig. 11:b). This suggests that in Carthage temples included such kind of columns and capitals bearing pomegranates exactly as it is known for Solomon’s Temple in Jerusalem and for the Temple of Melqart in Tyre.

5.2. Iberian Peninsula

The presence of pomegranate in the Iberian Peninsula possibly antedates its actual archaeological identification from the 6th century BC in the coastal region reached by Phoenicians, which probably were responsible for the introduction of such tree in Andalusia. From that time onwards, the cultivation of pomegranate extended to the whole peninsula not only on the coasts, but also in the hinterland. The earliest pomegranate was found in Huelva again demonstrating the stable connections established between the Tartessian culture and Phoenicians, who possibly were the source of the plant.

In the archaeological record, pomegranate is basically attested to in funerary contexts. The most ancient attestations are from the necropolis of La Fonteta (Valencia), where pomegranates are included into aristocratic tombs of the 6th century BC. Pomegranate-shaped pottery vessels are also known in the coeval necropolises of La Bobadilla (Jaén), and, successively, in the tombs of the first half of the 5th century BC of the necropolis of Túrgi (Granada) (fig. 11:c), and of the 4th century BC of Cerro del Santuario (Baza, Granada).

Also in Iberia, pomegranate presence in archaeological contexts increases with the strengthening of Carthage control over the region, as it is suggested by the great quantities of seeds of this fruit retrieved in Andalusian harbours, which also shows the importance of pomegranate trade for local economy at that time.

97 Presedo 1982, 205 (Tomb 155); Adroher Auroz - López Marco 1992, 23.
98 By instance, in the docks of the harbour of Tossal de les Basses (Alicante), a site of eastern Andalusia gravitating in the Punic orbit between the 5th and the mid-4th century BC, great concentrations of seeds were
From the 5th century BC pomegranate is attested to also in domestic contexts: in the residential quarter of Coimbra de Barranco Ancho (Jumilla), where a Punic amphora painted in red with a pomegranate garland was found (fig. 11:d). The presence in tombs is exemplified by findings in Cadiz. Pomegranate attestations in domestic contexts progressively increase between the 3rd and the 1st century BC. In the meantime, such fruit continues to be present in funerary contexts. Its popularity is demonstrated by its presence in several different places of ordinary life: in Puntal dels Llops (Olocau, Valencia) burnt pomegranate residuals were found inside an amphora (fig. 11:e); representations of pomegranates, moreover, are numerous also on painted pottery (fig. 11:F-g).

5.3. Phoenician and Punic Sardinia

The attestation of pomegranate in Phoenician and Punic Sardinia is mostly connected to the funerary realm. This fruit appears in funerary symbology as shown by a pomegranate-shaped vase found in a tomb of the Punic necropolis of Olbia. From Tharros, in the Collezione Chessa now in the National Museum at Sassari, are enlisted some golden pendants in the shape of pomegranates, a quite common feature also in the homeland, which can be dated from the 6th or 5th century BC (fig. 12:a).

Pomegranate presences increase between the end of the 6th and the 5th century BC, as the influence of Greek culture affects figurative art, and, especially votive choroplastic. From this period and following in the Hellenistic period the iconography of the enthroned goddess with polos, identified with Demeter, becomes very popular, who usually holds in her hands a dove, a torch, a piglet and a pomegranate (fig. 12:b). A terracotta fruit, found in Tharros during the excavations of September 1962, might be regarded as a quince, often associated to the pomegranate, which might be related to a found, together with grapes and olives, thus indicating the agricultural vocation of such region for fruits and vegetables production and as junction of trade of agricultural products.
Punic sanctuary devoted to Demeter located by the Torre San Giovanni, not far away from the city-wall of Punic origins.\textsuperscript{110}

On the basis of available archaeological evidence, it seems that pomegranate did not enjoy in Sardinia the same fortune that it achieved in other western Phoenician regions. The strict relationship established between Phoenician and Punic centres there with Carthage, which is typical of Sardinian culture from the 6\textsuperscript{th} century BC onwards, however, did not trigger the diffusion of the pomegranate in local pictorial art. Conversely, it is the circulation and imitation of a certain kind of Greek choroplastic, devoted to Demeter, which vehiculated the spread of the iconography of this fruit (fig. 12:c).\textsuperscript{111}

The attestation of the ways of cultivation of \textit{malum granatum} (i.e. \textit{malum punicum}) in Palladius,\textsuperscript{112} who owned \textit{agri} in Sardinia, in the territory of Neapolis (Othoca, on the southern bank of the Gulf of Oristano), a countryside celebrated for its warm climate and water abundance also known for the cultivation of citron (\textit{Citrus medica} L.) possibly started already at the times of Carthage.

5.4. \textit{Pomegranate in Phoenician and Punic Sicily}

Since the antiquity, Sicily had the fame of being a feracious land (τῆς καλλικάρπου Σικελίας λευρὸς γῶς; Aesch. \textit{Prom.}, 371) and, thus, it is an extremely favourite environment for growing a plant representing feracity as pomegranate. There are not data available to know when exactly \textit{Punica granatum} L. reached Sicily, whether in the 1\textsuperscript{st} millennium BC or earlier.

One of the earliest attestations is in Motya (see below § 6.) in the 8\textsuperscript{th} century BC and refers to a cult context. Pomegranates are apparently absent in the 7\textsuperscript{th} and 6\textsuperscript{th} century BC from Phoenician tombs of Sicily. However, in the following 5\textsuperscript{th} century BC with cultural Hellenisation they spread over both as pieces of the funerary goods and in iconography. Noticeably, in the 4\textsuperscript{th} and 3\textsuperscript{rd} century BC, majestic pomegranates are depicted on the painted funerary stelas from Lylibaeum (fig. 12:d).\textsuperscript{113}

The syncretistic process affecting Phoenician Astarte and Greek Demeter\textsuperscript{114} is much strong in Sicily than in Southern Italy, where the eastern Mistress of Animals/Mother Goddess of oriental origins merges with Hera. Sicily was a region devoted to agriculture since millennia, and there the cult of Demeter and Kore achieved a widespread popularity. Its overlapping to Astarte was a natural development and represents a hybridization of the Greek and oriental traditions.

6. POMEGRANATE IN MOTYA [LN-FS]

Motya is amongst the earliest Phoenician foundations in the West.\textsuperscript{115} Pomegranate (\textit{Punica granatum} L.) seeds were present in the sampled soil from Building C8,\textsuperscript{116} the

earliest warehouse erected by Phoenicians when they stably settled on Motya at the beginning of the 8th century BC. Burnt fragments of rind were found in the earliest Phoenician layers of Area D in pit P.1112 of the late 8th - 7th century BC. These finds suggest that the plant arrived at Motya with Phoenicians in the first centuries of the 1st millennium BC, even though the possibility that it reached the island before cannot be fully ruled out. Finding contexts point at ordinary consumption of the fruit; however, a single retrieval from the Temple of Astarte in the Sacred Area of the Kothon also documented about its cultic use.

6.1. The Temple of Astarte Aglaia [LN]

In the 2012-2017 seasons, a small temple devoted to Astarte was excavated in the north-eastern sector of the so-called Sacred Area of the Kothon, the largest religious compound of the Phoenician colony, occupying the southernmost quadrant of the island, enclosed by a Circular Temenos towards the mid of the 6th century BC. The dedication of the temple to Astarte was indicated by two inscriptions, a Punic and a Greek one, inscribed on later pottery fragments, mentioning respectively LRBT (“the Lady”) and AGL[AIA] (“the shining [Goddess]”).

The sacred building had a long history and four successive constructional phases have been excavated so far, a fifth and possibly other earlier stages of the building are still to be investigated. With the construction of the Circular Temenos, the original shrine was shifted towards the south in order to include it fully inside the sacred compound.

In the earliest phase so far explored (Phase 8, Motya IVB, 750-675 BC), a rectangular building was brought to light called “Shrine C12” (fig. 13:a). It measures 8.3 × 4.1 m and was entered through a 1.65 m-wide door at the northern extremity of its eastern side, flanked by two protruding half-pillars. The cult focus of the mono-cellular temple was a podium erected at the centre of the short southern side, which possibly supported a cult statue (a bronze earring and a pinecone possibly belonged to a cult figurine were found here: fig. 13:d). On both sides of the room run two benches, made of mud-bricks, possibly used either as seats or for offerings. Just aside the bottom of the northern side of the western bench, a globular pottery vessel (of a type later called “ink-bottle”) was found in situ on the floor.

The vessel was handmade with a grey rough ceramic fabric (3/N very Dark Gray), with a beige clayish coating applied on its outer surface (5Y8/2 Pale Yellow) (fig. 13:b-c). The rim shows a series of oblique indentations resembling the six/seven leaves of the fruit crown. The spherical body was squatted and slightly irregular with the typical shallow recesses of ripe pomegranate. The bottom was flat-cut, with signs of the clay coils. The shape of the vase is a faithful replica of the fruit. Unfortunately, it is not possible to know if there was an outer paint over the beige coating. Similar vases are known in the Phoenician homeland (see above § 2.) and they include those applied on kernoi. The shape indicates the function of container of the vase, which is not a simple replica of the fruit.

116 Nigro 2013, 45.
117 A catalogue of inscriptions to Astarte at Motya in Bonnet 1996, 119-120.
The vase content was sampled twice and analysed in the Labs of Sapienza University. Data collected suggest that inside the vase there was an organic fluid, leaving traces of iron oxide (pomegranate juice, blood?). The finding spot of the vase points to a use in the temple of the liquid for consumption by worshippers, or libation, or as offering to the Goddess. A possible curative property of the vase content may be also recalled as being consistent with the religious context in an area where sacred springs provided fresh water for healing people.

6.2. The sacred wells P.2927 and P.1660

Another retrieval of pomegranate in situ occurred in the south-western sector of the Sacred Area of Kothon, inside a well connected to the cult of Astarte. Remains of cult activities performed during the 5th century BC were identified in wells P.2927 and P.1660.

The inner fillings of wells contained offerings pointing to a chthonic cult: stone insignia and shells, and, more noticeably from our point of view, seeds of pomegranate, as well as an iron key, and weaving tools which refer to the agrarian and pastoral world. Animal remains which include young pigs, goats, and valuable parts of cows, reflect ritual consumptions of meat.

The analysis of finds suggests a possible connection to the cult of the divine couple Baal - Astarte, the titular deities of the main temples of the Sacred Area since the 8th century BC.

During the 5th century BC, on the wave of cultural Hellenisation, the divine couple Baal - Astarte was assimilated with Poseidon - Demeter, fully fitting into the Sicilian koine. Astarte is thus worshipped with the attributes and the outfit of Demeter, as illustrated by some objects found not far from the wells area: a fragmented terracotta representing a female divinity enthroned, holding a pomegranate on her hand (fig. 12:e), a clay mold of a goddess wearing a polos, an ivory amulet in the shape of a turtle dove and, finally, several fragments of iron keys connected to the figure of Demeter as a protector of childbirth.

7. CONCLUSIONS

Across millennia, from the Middle East to the far West of Mediterranean, pomegranate achieved a major role in the economy and ordinary life of ancient peoples, as well as in

---

119 Phreatic aquifer was collected in a series of wells dug up east of Building C8 since the earliest settlement on the island (Nigro - Spagnoli 2017, 12-17); when the area was refurbished with the erection of the Circular Temenos these installations were re-used for religious purposes.

120 Veronese 2006, 56; Tantillo 2012.

121 Ampolo 2012, 25.

122 Syncretic phenomena between Astarte and Demeter are not unusual in Phoenician culture and more generally in the Mediterranean. In the Temple of Astarte at Kition, the goddess is represented as Demeter/Mother goddess on the Greek Red-FIGured vases found as offerings and cult-vessels (Chirpanlieva 2010, 188, fig. 1:12-13). A similar syncretism takes place in Etruria where, from the 6th century BC, the Etruscan chthonic deities linked to the nature and the underworld assume the characteristics of Demeter/Ceres, borrowing rites and forms of devotion (Bonamici 2005, 5; Belelli Marchesini et al. 2012, 230, 236).

123 Chiarenza 2015, 55, fn. 27.

124 Spagnoli 2013, 159; Chiarenza 2015, 53, fn 19; Nigro 2015, 239-240, figs. 16-17; 2016, 44-45.

symbolic and religious realms in connection with life and death. Each different culture, since the 3rd millennium BC onwards, found its way to include it into etiological narrations which could explain its numerous positive peculiarities. Pomegranate, with grapes and figs, became a typical fruit of the Levantine, Aegean and Mediterranean societies, as well as a major symbol in afterlife of rebirth and fecundity.

Furthermore, again from the beginning, it was considered a divine fruit and, from this reason it was strictly connected with power, passing from the hands of the gods to those of the kings. In Syria-Palestine it became a typical finial of royal scepters and a regular decorative motive of priests and aristocratic robes and jewelers. Phoenicians and Carthaginians played, also in this case, a determinant role in its diffusion, especially because they transmitted to the West its most ancient oriental meanings and uses, and at the same time, they were able to merge them with significances arriving from the Aegean and Greek world. The golden pome filled up with ruby-red seeds thus became a symbol of prosperity and power which was preserved until nowadays. The sanctuary of the “Madonna del Granato” at Capaccio (Salerno, Italy) near Paestum (fig. 14:a-c), 127 was erected just upon a Temple of Hera dominating the valley of the Sele river. 128 There the Holy Mary is portrayed in a painted statue holding a pomegranate as finial of the scepter in her right hand, replicating the sacred gesture and the attribute of the ancient Greek deity.

The fortune of this iconography in the Western World is witnessed by many visual quotations in Medieval and especially Renaissance art, which can be epitomized by Sandro Botticelli’s “Madonna della melagrana” in the Uffizi Gallery at Florence (fig. 15:a), where an infant baby Jesus is holding the fruit symbol of life (fig. 15:b), or the sumptuous clothing of Princess Eudoxia decorated by pomegranate blossoms (fig. 15:c), appearing on the masterpiece of the end of the 15th century AD, nowadays in the Museu Nacional d’Art de Catalunya at Barcelona. 129.

Fig. 1 - Plant and fruit of pomegranate from an 18th century AD herbarium.
Fig. 2 - Mesopotamia: a - hematite stamp seal of the Late Uruk period representing a schematic pomegranate fruit (3300-3100 BC); b-c - carved alabaster vase from Uruk-Warka (3500-3300 BC); in the lower register (c), three branches pomegranate trees; d - Neo-Assyrian cylinder seal impression showing a couple of kings and eagle-headed winged genia performing ritual aspersion of a pomegranate bush as Tree of Life; d - Middle Assyrian ivory inlays from a box representing the God of the gushing water flanked by pomegranate trees (13th century BC).
Fig. 3 - Middle-Late Bronze Age Levant: a - plan of Temple III at Tell ed-Dab’a in the Eastern Nile Delta. Seeds of pomegranate were found in the courtyard (in green); b - desiccated pomegranate fruits from Tomb B35 at Jericho (MB IIB); c - pomegranate-shaped wooden box from Tomb 35 Jericho (MB IIB); d - pendants in shape of pomegranate from Megiddo found in Palace 2041, “Treasure 3073” (Late Bronze Age IIB, stratum VIIA); e - Golden pomegranate pendants on exhibit in the Israel Museum, Jerusalem.
Fig. 4 - Egypt: a - breccia miniature stone jar of Proto-Dynastic period in the shape of a pomegranate. Note that the colour of the stone resembles that of the original blossom; the shape is that of *Punica protopunica* L.; b-c - steatite and ivory replicas of pomegranate from the Tomb of Tutankhamon; d - silver pomegranate-shaped ritual vessel from the Tomb of Tutankhamon; e - the “Syrian Garden” wall relief of Thutmose III at Karnak.
Fig. 5 - Ugarit: a - golden hemispherical bowl found in the Temple of Baal with chiselled pomegranates garland; b - bronze stand for incense-burner with pomegranate pendants as decorations.
Fig. 6 - Late Bronze - Iron Age Levant and Cyprus: a - golden necklace from Ayios Iakovos, Cyprus; b - golden pendant in the form of pomegranate decorated with rows of granulated triangles from Enkomi tomb (13th century BC); c - ivory sceptre finial in shape of pomegranate from Megiddo, stratum IV (Iron IIB); d - pomegranate-shaped vessel (globlet) from Tell Qasile, Building L; e-f - pomegranate shaped vessels with red-slipped surface and black painted bands from Temple 131 at Tel Qasile; g - circular kernos from Megiddo (stratum VI).
Fig. 7 - Iron Age Levant and Mesopotamia: a - bronze sceptres with pomegranate finials from Tell en-Nami; b - ivory pomegranate from the illegal market of antiquities, Israel Museum, Jerusalem (8th century BC); c - bronze thymiaterion from Tell en-Nami with decorative pomegranate pendants; d - ivory pomegranate finial with a dove on the top, Israel Museum, Jerusalem; e-f - Phoenician glass models of pomegranate, Israel Museum, Jerusalem; g - Nineveh, wall relief from the Northern Palace of Assurbanipal representing the King under an umbrella with pomegranate like finials and locks; h - Persepolis, wall relief showing a priest under a shadow umbrella of Assyrian type.
Fig. 8 - Nimrud: jewellery from the Queens’ tombs discovered underneath the North-West Palace of Ashurnasirpal II: a, g, h - golden earrings with agate pendants; b, c, f - golden pomegranate-shaped pendant; d-e - votive pomegranate models respectively of ivory and rock crystal; i-l - golden diadems with agate insets.
Fig. 9 - Greece: a - golden earrings from the tomb of the Rich Lady of Areopagus, Athens, (mid-8th century BC); b - votive kernos from the Heraion of Samos (second half of 7th century BC); c - pomegranate clay model from the Heraion of Samos; d - pomegranate vase from Athens, Geometric Period; e - pomegranate vase from Rhodes (mid-6th century BC); f - painted decoration of a White-ground Attic lekythos showing a young woman carrying ribbons and pomegranates, contained in a large basket, and a lekythos as gifts to a warrior, perhaps the deceased standing near a (funerary?) stelae (mid-5th century BC); g - funerary relief from Chrysapha (Sparta), probably representing enthroned Hades and Persephone/Kore. The goddess holds a pomegranate in her right hand (550-540 BC).
Fig. 10 - Southern Italy and Magna Graecia: a - clay model of pomegranate from Tempa Cagliozzo di San Martino d’Agri (PZ); b - clay statuette of Demeter from Ferrandina, Metaponto (MT), holding a *patera* and a pomegranate on her hands (4th century BC); c - Paestum (SA), Tomb 87 of Spina Gaudio (4th century BC); d - Braida del Vaglio (PZ), jewels from Tomb 102 (6th century BC).
Fig. 11 - North Africa and Iberia: a - La Ghorfa (Maktar) funerary stelae (2nd century BC); b - Carthage, stelae from the Tophet (2nd century BC); c - Tútugi necropolis (Granada), stone cover knob in shape of pomegranate (5th century BC); d - Coimbra de Barranco Ancho (Jumilla), Punic amphora painted in red with a pomegranate garland (5th century BC); e - Puntal dels Llops (Olocau, Valencia), carbonized seeds of pomegranate found inside a Punic amphora (beginnings of 2nd century BC); f - Edeta/Tossal de Sant Miquel de Lira (Valencia), painted jar no.6 dep. 5, particular of the upper decoration with pomegranate tree; g - Puntal dels Llops (Olocau, Valencia), particular of the painted vegetal decoration with a pomegranate tree at the centre of the jar no. 4084 dep. 4.
Fig. 12 - Sardinia and Sicily: a - golden pendants in the shape of pomegranates from Tharros, *Collezione Chessa* (D63 and D64) (6th-5th century BC); b - terracotta enthroned goddess with polos, identified with Demeter from Tharros (5th-4th century BC); c - Hellenistic terracotta representing Demeter seated in throne wearing a multiple necklace of shoots and pomegranates; d - Lylibaeum (Marsala). Punic funerary stelae illustrating a scene of banquet and decorated on the basis with pomegranates and a quince; e - Motya (Sicily), fragment of a terracotta plaquette (MC08.210) representing a female hand holding a pomegranate, found in the sacred Area of the Kothon (5th century BC).
Fig. 13 - Motya: a - plan of the Temple of Astarte (Shrine C12) with indication of the finding spot of the pomegranate vase, Motya IVB, Phase 8, 750-675 BC; b-c - pomegranate vase MC.16.5046/1 found inside the Temple of Astarte at Motya (same dating); d - bronze miniature earring and pinecone found in Shrine C12 possibly belonged to a cult figurine.
XXII (2018) Pomegranate (*Punica granatum* L.) from Motya and its deepest oriental roots

Fig. 14 - Capaccio (Paestum): a - statue of the “Madonna del Granato” in the homonym church at Capaccio Vecchio (Salerno, Italy), beginning of the 18th century AD; b - detail of the sceptre with pomegranate finial in the right hand of the Holy Mary; c - aerial view of the Sanctuary of the “Madonna del Granato” built in the 10th century AD as reminiscent of the former Temple of Hera in the underlying valley of river Sele, near Salerno/Paestum; d - seated limestone statue of the Goddess Hera holding a *patera* and a pomegranate from the Hearion by the mouth of river Sele, not far away from Capaccio in the Salerno/Paestum Plain.
Fig. 15 - Renaissance paintings: a - Firenze, Galleria degli Uffizi Sandro Botticelli, “La Madonna della melagrana”, 1487, tempera on wood panel; b - detail of the infant baby Jesus holding a pomegranate; c - Barcelona, Museu Nacional d’Art de Catalunya, “The Exorcism of Princess Eudoxia before the tomb of Saint Stephen”, Jaume Vergos II, 1495-1500, tempera, stucco reliefs and gold leaf on wood panel.
